

# Programming language

A language used to write instructions for the computer.

C#

Objective-C

C++

python

Perl

JavaScript

THE  
C  
PROGRAMMING  
LANGUAGE

## Vocabulary(Keywords)

English	Python
Hello	If
Open	Switch
Write	For

## Grammar(Syntax)

English	Python
Cat is.	Print ( )
Cats is.	Print { }

# Variables(named values)

- Placeholder of information for later use.
- Value stored is changeable.
- We store values inside variables using the “=” sign (x=2, z=“Hello”).

# Variable name rules

---

- Must **start** with a letter(A-z) or underscore(\_)
- can only **contain** alpha-numeric characters and underscores (a-Z 0-9, and \_)
- names are case-sensitive (address vs ADDRESS)

Valid	Invalid
address	3address
_address	*address
address99	my address
my_full_address	my-full-address

# Operators

Symbol used to perform operations on variables and other values

Operator	Description	Examples
=	Assignment(bind name to value)	x=2 z = 15 name="Alex"
+, -, x, /	Arithmetic	2+5 Y-3 number/2
==, !=, <, <=, >, >=	Comparison. Output is either true or false	3==5 -> false 5<10 -> true 9<=9 -> true
<b>And</b> (true if both sides are true) <b>Or</b> (true if either side is true) <b>Not</b> (reverse value)	Logical. Output is either true or false	9<5 <b>AND</b> 2<8 -> false 9<5 <b>OR</b> 2<8 -> true <b>NOT</b> 7==4 -> true

# Statement vs expression

- **Statement:** a line of code that does something.

- Examples:

1) **Import statement:**

**Import** pandas

2) **If statement:**

**If** x<3

- **Expression:** a combination of variables, operators, and values that's evaluated to ***one single value***

- Examples:

X=3

Y=6

Z=2

1) X \* 2 + Y / Z -> 9

2) X \* Y \* Z + 5 -> 41

3) X > 9 -> false

4) Y + 6 == 12 -> true
